Sustainability: Product Recycled Content

1. Recycled content - %Pre-consumer Recycled content

Pre-consumer scrap is calculated from in plant scrap that is re-melted. This is a total 6.4% of melted production. It excludes Steel Plant revert of a further 8.9% which is recycled in the steel making and casting process itself. Total pre-consumer recycled is therefore 15.3% of melted production.

2. Recycled content - %Post-consumer Recycled content

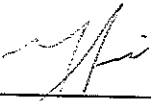

Post consumer scrap is calculated from purchased recycled scrap metal used as a raw material into the process. This amounts to 58% of total melting production.

3. Total recycled content

The total recycled content input as percentage of melt production is therefore 73.3%

The percentages above are calculated from total production and may vary per product.

Yours faithfully

NJ Fourie
